

Task 1: Install and Verify Firewall

Install firewall

- `yum -y install firewalld`

Start firewall

- `systemctl start firewalld`

Enable firewall

- `systemctl enable firewalld`

Check Firewall status

- `systemctl status firewalld`

Verify using firewall-cmd

- `firewall-cmd --state`

Task 2: Allow HTTP (Port 80)

Add HTTP service permanently

- `firewall-cmd --permanent --add-service=http`

Reload firewall

- `firewall-cmd --reload`

Verify HTTP rule

- `firewall-cmd --list-services`

Task 3: Block Port 8080 and Test

Start a simple web server on port 8080

- `cd /var/www/html`
- `python3 -m http.server 8080`

Block port 8080

- `firewall-cmd --permanent --remove-port=8080/tcp`
- `firewall-cmd --reload`

Verify:

- `firewall-cmd --list-ports`

Test from browser

- `http://<Server-IP>:8080`

Task 4: Display Firewall Zones

List all zones

- firewall-cmd --get-zones

Check active zones

- firewall-cmd --get-active-zones

Display allowed services

- firewall-cmd --zone=public --list-services

Display allowed ports

- firewall-cmd --zone=public --list-ports

Task 5: Remove HTTP Rule

Remove HTTP service

- firewall-cmd --permanent --remove-service=http

Reload firewall

- firewall-cmd --reload

Verify

- firewall-cmd --list-services
