

Task 1: Install Apache Web Server

Install Apache (httpd):

- `Sudo yum -y install httpd`

Task 2: Start Apache Service

Start the service:

- `sudo systemctl start httpd`

Enable it to start automatically after reboot:

- `sudo systemctl enable httpd`

Check status:

- `sudo systemctl status httpd`

Check firewall:

- `sudo firewall-cmd --state`

Allow HTTP:

- `sudo firewall-cmd --permanent --add-service=http`

Reload firewall:

- `sudo firewall-cmd --reload`

Verify:

- `sudo firewall-cmd --list-services`

Task 3: Stop, Start and Restart Apache

Stop Apache

- `sudo systemctl stop httpd`

Check status

- `sudo systemctl status httpd`

Start Apache again

- `sudo systemctl start httpd`

Restart Apache

- `sudo systemctl restart httpd`

Reload configuration

- `sudo systemctl reload httpd`

Task 4: Verify Apache is Running

Check your IP address:

- ip addr

Open your browser and visit:

- <http://192.168.1.100>

Task 5: Apache vs Nginx

Apache is process/thread-based, highly configurable, and supports .htaccess files, making it suitable for shared hosting and dynamic websites.

Nginx is event-driven, lightweight, and handles many simultaneous connections efficiently. It is commonly used as a reverse proxy, load balancer, and for serving high-traffic websites.
