

Task 1: Install BIND9 and Verify Installation

Install BIND9

- `sudo dnf install -y bind bind-utils`

Enable and Start the DNS Service

- `sudo systemctl enable --now named`

Check the service status:

- `sudo systemctl status named`

Verify the Installed Version

- `named -v`

Task 2: Configure a DNS Zone for myzomatoclone.local

Steps:

1. Create the Zone File

- Copy the default zone file:
 - `sudo cp /var/named/named.localhost /var/named/myzomatoclone.local.zone`

2. Edit the Zone File

- `sudo nano /var/named/myzomatoclone.local.zone`
 - Replace its contents with:

```
$TTL 1D
@      IN SOA  ns1.myzomatoclone.local.
      admin.myzomatoclone.local. (
                                2026072501
                                1D
                                1H
                                1W
                                3H )
```

```
                                IN NS   ns1.myzomatoclone.local.
ns1      IN A    127.0.0.1
@        IN A    127.0.0.1
```

3. Edit named.conf

- `sudo nano /etc/named.conf`
 - Add the following at the end:

```
zone "myzomatoclone.local" IN {  
    type master;  
    file "myzomatoclone.local.zone";  
};
```

4. Check Configuration

- sudo named-checkconf
 - Check the zone:
 - sudo named-checkzone myzomatoclone.local /var/named/myzomatoclone.local.zone
 - Restart DNS:
 - sudo systemctl restart named

Task 4: Add a CNAME Record

Edit the zone file:

- sudo nano /var/named/myzomatoclone.local.zone

Add:

- foodsearch IN CNAME myzomatoclone.local.

Check the zone:

- sudo named-checkzone myzomatoclone.local /var/named/myzomatoclone.local.zone

Reload DNS:

- sudo systemctl restart named

Verify:

- dig foodsearch.myzomatoclone.local

Task 5: Find and Fix the Error

Incorrect Zone File

```
myzomatoclone.local. IN A 127.0.0.1  
foodsearch IN CNAME myzomatoclone.local.
```

Correct Zone File

```
$TTL 1D  
@ IN SOA ns1.myzomatoclone.local.  
admin.myzomatoclone.local. (  
    2026072501
```

1D
1H
1W
3H)

IN NS ns1.myzomatoclone.local.

ns1 IN A 127.0.0.1
@ IN A 127.0.0.1
foodsearch IN CNAME myzomatoclone.local.

Check again:

- sudo named-checkzone myzomatoclone.local
/var/named/myzomatoclone.local.zone

Reload the service:

- sudo systemctl restart named
