

Task 1: install UFW and Verify Status

Install UFW

- `sudo dnf install epel-release -y`
- `sudo dnf install ufw -y`

Enable the UFW service

- `sudo systemctl enable ufw`
- `sudo systemctl start ufw`

Enable the firewall

- `sudo ufw enable`

Check the status

- `sudo ufw status verbose`

Task 2: Allow Only SSH (Port 22)

Set the default policies:

- `sudo ufw default deny incoming`
- `sudo ufw default allow outgoing`

Allow SSH:

- `sudo ufw allow 22/tcp`

Verify:

- `sudo ufw status numbered`

Task 3: Allow Outgoing HTTP/HTTPS Only

Change the default outgoing policy:

- `sudo ufw default deny outgoing`

Allow HTTP:

- `sudo ufw allow out 80/tcp`

Allow HTTPS:

- `sudo ufw allow out 443/tcp`

Verify:

- `sudo ufw status verbose`

Task 4: Save Firewall Rules

Display the rules:

- `sudo ufw status numbered`

Save them to a file:

- `sudo ufw status numbered > ~/firewall_rules.txt`

Verify:

- `cat ~/firewall_rules.txt`

Task 5: Short Explanation

- The current UFW configuration allows only SSH connections on port 22 while blocking all other incoming traffic. Outgoing traffic is restricted to HTTP (80) and HTTPS (443) only. If a local web server is running on another port (such as 8080 or 5000), clients will not be able to access it unless that port is explicitly allowed in the firewall.
